Never sacrifice accuracy

Our clients love our cluster map technology which builds a visualization of keyword relationships.

Innovative, powerful, and simple – exactly the tools you need to conquer today's data challenges and deliver world class results.

Professional service providers and large corporations are involved in an increasing number of digital investigations involving email, cellphones and other electronic data. Investigations can involve claims of fraud, improper use of assets, data theft, compliance, human resource violations and/or criminal activity.

Case studies

This Fortune 500 insurance company had all the data challenges you would expect from being one of the largest insurance providers in the U.S. After investigating other products, Intella was deployed, concluding:

"Intella has delivered the features and performance of a higher-end forensics or e-discovery review tool, but requires much less forensic expertise to generate high quality results and at a much lower cost. It easily handles the complex searches, large data sets, heavy caseloads and diverse forensic and e-discovery needs of a global insurance provider, yet is easy to use and highly accurate."

This Fortune 500 retailer saved millions on outside vendor support by bringing discovery in-house. Subject matter experts & attorneys now rapidly search large data sets for important documents that are critical for litigation while culling large volumes of irrelevant data – thus saving time and minimizing the expense of document reviews, leading their in-house team to conclude:

"We've increased efficiency so much with Intella, we've been able to internalize not just e-discovery and document review, but also processing and matter management. We had no idea how dramatically Intella would improve the efficiency of our organization."

Additional Information

- PST, OST, DBX, NSF, Mbox and IMAP can all be processed using Intella®
- Analysis of cloud sources including Dropbox, Office 365 (incl. OneDrive), SharePoint, Gmail and iTunes backup
